

## Chapter 4 Exponential and Logarithmic Functions

### Section 4.1

**Algebraic functions** – Functions of  $x$  that can be expressed as a finite number of sums, differences, multiples, quotients, powers and roots

**Transcendental functions** – Functions that are not algebraic

**Exponential function with base  $a$**  – The exponential function  $f$  with base  $a$  is denoted by  $f(x) = a^x$  where  $a > 0$ ,  $a \neq 1$ , and  $x$  is any real number

**Natural base** – The irrational number  $e \approx 2.71828 \dots$

**Natural exponential function** – The function  $f(x) = e^x$

### Section 4.2

**Logarithmic function with base  $a$**  – For  $x > 0$  and  $0 < a \neq 1$ ,  $y = \log_a x$  if and only if  $x = a^y$ . The function given by  $f(x) = \log_a x$  is called the logarithmic function with base  $a$

**Common logarithmic function** – The logarithmic function with base 10

**Natural logarithmic function** – The logarithmic function with base  $e$  given by  $f(x) = \ln x$ ,  $x > 0$

### Section 4.3

**Change-of-base formula** – (Informal) Formula used to evaluate logarithms of bases other than 10 or  $e$

(Formal) Let  $a$ ,  $b$ , and  $x$  be positive real numbers such that  $a \neq 1$ ,  $b \neq 1$ . Then  $\log_a x$  can be converted to a different base using any of the following formulas:

$$\log_a x = \frac{\log_b x}{\log_b a}, \quad \log_a x = \frac{\log_{10} x}{\log_{10} a}, \quad \text{or} \quad \log_a x = \frac{\ln x}{\ln a}$$

### Section 4.5

**Exponential growth model** – The mathematical model given by  $y = ae^{bx}$ ,  $b > 0$

**Exponential decay model** – The mathematical model given by  $y = ae^{-bx}$ ,  $b > 0$

**Gaussian model** – The mathematical model given by  $y = ae^{-(x-b)^2/c}$

**Logistic growth model** – The mathematical model given by  $y = \frac{a}{1 + be^{-rx}}$

**Logarithmic models** – The mathematical models given by  $y = a + b \ln x$  and  $y = a + b \log_{10} x$

**\*Normally distributed** – *The context of the text does not provide adequate detail from which to define this concept. I do not think it's appropriate here to use a statistical definition.*

**Bell-shaped curve** – The graph of a Gaussian model

**Logistic curve** – A model for describing populations initially having rapid growth followed by a declining rate of growth

**Sigmoidal curve** – Another name for a logistic growth curve
