Section 2.5 The Fundamental Theorem of Algebra

Course Number

Instructor

Date

Objective: In this lesson you learned how to determine the numbers of zeros of polynomial functions and find them.

Important Vocabulary Define each term or concept.

Fundamental Theorem of Algebra

Linear Factorization Theorem

Conjugates

I. The Fundamental Theorem of Algebra (Pages 139–140)

What you should learn
How to use the Fundamental Theorem of Algebra to determine the number of zeros of a polynomial function and find all zeros of polynomial functions, including complex zeros

In the complex number system, every *n*th-degree polynomial function has _____ zeros.

Example 1: How many zeros does the polynomial function $f(x) = 5 - 2x^2 + x^3 - 12x^5$ have?

An *n*th-degree polynomial can be factored into _____ linear factors.

Example 2: List all of the zeros of the polynomial function $f(x) = x^3 - 2x^2 + 36x - 72$.

II. Conjugate Pairs (Page 141)

What you should learn
How to find conjugate pairs of complex zeros

Let $f(x)$ be a polynomial function that has real coefficients. If $a + bi$, where $b \neq 0$, is a zero of the function, then we know that _____ is also a zero of the function.

III. Factoring a Polynomial (Pages 141–143)

What you should learn
How to find zeros of polynomials by factoring

To write a polynomial of degree $n > 0$ with real coefficients as a product without complex factors, write the polynomial as . . .

A quadratic factor with no real zeros is said to be

_____.

Example 3: Write the polynomial $f(x) = x^4 + 5x^2 - 36$
(a) as the product of linear factors and quadratic factors that are irreducible over the reals, and
(b) in completely factored form.

Explain why a graph cannot be used to locate complex zeros.
