

# PART B

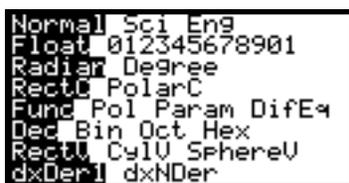

## TEXAS INSTRUMENTS TI-85/TI-86 GRAPHING CALCULATORS

### Setup

---

When using this *Guide*, you should always, unless instructed otherwise, use the calculator setup specified below for both the TI-85 and TI-86. Before you begin, check the basic setup with **2nd** **MORE** (MODE). Use the following instructions to choose the settings shown in Figure 1. Check the window format with **GRAPH** **MORE** **F3** (FORMT). Choose the settings shown in Figure 2.

- If you do not have the darkened choices shown in Figures 1 and 2 (below), use the arrow keys to move the blinking cursor over the setting you want to choose and press **ENTER**.
- Press **EXIT** or **2nd** **EXIT** (QUIT) to return to the home screen.

FIGURE 2

**For the TI-85** Return to the home screen with **EXIT** or **2nd** **EXIT** (QUIT). Specify the statistical setup as shown in Figure 3 by pressing **2nd** **[-]** (LIST) **F1** (I) **0** **F2** (I) **STO** **7** (L) **ALPHA** **1** **ENTER** **2nd** **ENTER** (ENTRY) **◀** **2** **ENTER**. (See Figure 3.) Press **EXIT** or **2nd** **EXIT** (QUIT) to return to the home screen.

**For the TI-86** Return to the home screen with **EXIT** or **2nd** **EXIT** (QUIT). Specify the statistical setup as shown in Figure 6 by pressing **2nd** **[-]** (LIST) **F5** (OPS) **MORE** **MORE** **MORE** **F3** (SetLE) **ALPHA** **7** (L) **1** **,**

**[ALPHA]** **[7]** (L) 2 **[,]** **[ALPHA]** **[7]** (L) 3 **[,]** **[ALPHA]** **[7]** (L) 4 **[,]** **[ALPHA]** **[7]** (L) 5 **[ENTER]**. (See Figure 4.) Press **[EXIT]** or **[2nd]** **[EXIT]** (QUIT) to return to the home screen.

TI-85 Statistical Setup  
FIGURE 3

TI- 86 Statistical Setup  
FIGURE 4

**TI-86 Note:** Because appropriate TI-86 computer linking software had not yet been perfected at the time this material was written, TI-86 screens in this *Guide* appear smaller than the TI-85 screens. Screens that appear the same on both calculators are shown for the TI-85.

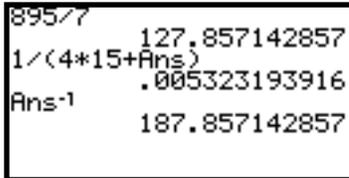

## Basic Operation

You should be familiar with the basic operation of your calculator. With calculator in hand, go through each of the following.

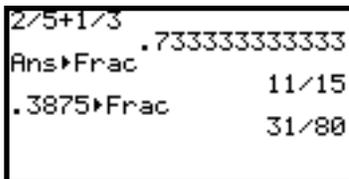

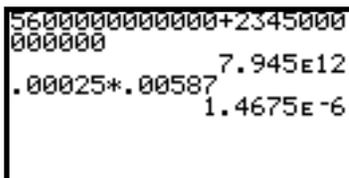

- CALCULATING** You can type in lengthy expressions; just make sure that you use parentheses when you are not sure of the calculator's order of operations. As a general rule, numerators and denominators of fractions and powers consisting of more than one term should be enclosed in parentheses.

<p>Evaluate <math>\frac{1}{4 * 15 + \frac{895}{7}}</math>. Evaluate <math>\frac{(-3)^4 - 5}{8 + 1.456}</math>.</p> <p>(Use <b>[(-)]</b> for the negative symbol and <b>[-]</b> for the subtraction sign.)</p>	
<p>Evaluate <math>e^{3*0.027}</math> and <math>e^{3*0.027}</math>.</p> <p>The calculator will assume you mean the first expression unless you use parentheses around the two values in the exponent. (It is not necessary to type in the 0 before the decimal point.)</p>	

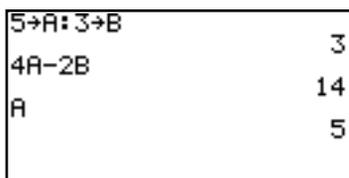

- USING THE ANS MEMORY** Instead of again typing an expression that was evaluated immediately prior, use the answer memory by pressing **[2nd]** **[(-)]** (ANS).

<p>Calculate <math>\left(\frac{1}{4 \cdot 15 + \frac{895}{7}}\right)^{-1}</math> using this nice shortcut.</p> <p>(If you wish to clear the home screen, press <b>CLEAR</b> .)</p>	 <p>895/7      127.857142857 1/(4*15+Ans)             .005323193916 Ans^-1      187.857142857</p>
--	--

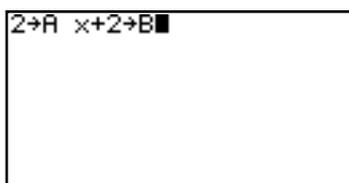

3. **ANSWER DISPLAY** When the denominator of a fraction has no more than three digits, your calculator can provide the answer in fraction form. When an answer is very large or very small, the calculator displays the result in scientific notation.

<p>The “to a fraction” key is obtained by pressing <b>2nd</b> <b>X</b> (MATH) <b>F5</b> (MISC) <b>MORE</b> <b>F1</b> (Fr</p>	 <p>2/5+1/3      .733333333333 Ans&gt;Frac      11/15 .3875&gt;Frac      31/80</p>
<p>The calculator's symbol for “times 10<sup>12</sup>” is 1000,000,000,000.</p> <p>The result 1.4675 × 10<sup>-6</sup>, the scientific notation expression for 0.0000014675.</p>	 <p>5600000000000+2345000 000000      7.945E12 .00025*.00587      1.4675E-6</p>

4. **STORING VALUES** Sometimes it is beneficial to store numbers and expressions for later recall. To store a number, type the number on the display and press **STO** . (Note that the cursor automatically changes to alphabetic mode when you press **STO** .) Next, press the key corresponding to the letter in which you wish to store the value, and then press **ENTER** . To join several short commands together, use **2nd** **.** (:).

<p>Store 5 in <i>A</i> and 3 in <i>B</i>, and then calculate <math>4A - 2B</math>.</p> <p>To recall a value stored in a variable, use <b>ALPHA</b> to type the letter in which the expression or value is stored and then press <b>ENTER</b> . The value stays stored until you change it.</p>	 <p>5→A:3→B      3 4A-2B      14 A      5</p>
--	--

5. **ERROR MESSAGES** When your input is incorrect, an error message is displayed.

<p>If you have more than one command on a line without the commands separated by a colon (:), an error message results when you press <b>ENTER</b> .</p>	 <p>2→A x+2→B■</p>
--	---

<p>Choose <b>F1</b> (Goto) to position the cursor to the place the error occurred so that you can correct the mistake or choose <b>F5</b> (Quit) to begin a new line on the home screen.</p>	 <p>The image shows a calculator screen with the text "ERROR 07 SYNTAX" at the top. Below the error message, there is a menu bar with two options: "GOTO" on the left and "QUIT" on the right. The screen is framed by a black border.</p>
--	---

# Chapter 1 Ingredients of Change: Functions and Linear Models

## 1.1 Fundamentals of Modeling

There are many uses for a function that is entered in the graphing list. Graphing the function in an appropriate viewing window is one of these. Because you must enter all functions on one line (that is, you cannot write fractions and exponents the same way you do on paper) it is very important to have a good understanding of the calculator's order of operations and to use parentheses whenever they are needed.

### 1.1.1 ENTERING AN EQUATION IN THE GRAPHING LIST Press

**GRAPH** **F1** ( $y(x)=$ ) to access the graphing list. Up to 99 equations can be entered in the graphing list, and the output variables are called by the names  $y_1, y_2$ , etc. When you intend to graph an equation you enter in the list, you must use  $x$  as the input variable.

If there are any previously entered equations that you will no longer use, clear them out of the graphing list.

Position the cursor on the line containing the equation and press **CLEAR** or **F4** (DELf) .

Suppose you want to graph  $A = 1000(1 + 0.05)^t$ . Because we intend to graph this equation, the input must be called  $x$ . Type  $x$  by pressing **x-VAR** or **F1** ( $x$ ), not the times sign **X** .

**TI 85** For convenience, we use the first, or  $y_1$ , location in the graphing list. Enter the right hand side as

$$1000(1 + 0.05)^x$$

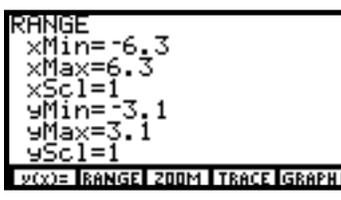

**TI 86** For convenience, we use the first, or  $y_1$ , location in the graphing list. Enter the right hand side as

$$1000(1 + 0.05)^x$$

Plot1, Plot2, and Plot3 at the top of the  $y(x)=$  list should not be darkened. If any of them are, use **▲** until you are on the darkened plot name. Press **ENTER** to make the name(s) not dark.

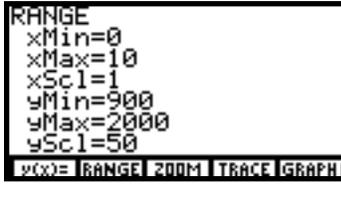

### 1.1.2 DRAWING A GRAPH If you have not already done so, enter the equation in the $y(x)=$ list using $x$ as the input variable before drawing a graph. We now draw the graph of $y = 1000(1 + 0.05)^x$ .

<p>Remove the lower menu with <b>EXIT</b>, and press <b>F3</b> (ZOOM) <b>MORE</b> <b>F4</b> (ZDECM).</p> <p>Notice that the graphics screen is blank.</p>	
<p><b>TI-85</b> Press <b>EXIT</b> <b>F2</b> (RANGE) to see the view set by ZDECM.</p>	
<p><b>TI-86</b> Press <b>EXIT</b> <b>F2</b> (WIND) to see the view set by ZDECM.</p>	

- **Both** xMin and xMax are the settings of the left and right edges of the viewing screen, and yMin and yMax are the settings for the lower and upper edges of the viewing screen. xScl and yScl set the spacing between the tick marks on the x- and y-axes. The view you see is  $-6.3 \leq x \leq 6.3$ ,  $-3.1 \leq y \leq 3.1$ .

Follow the procedures shown in either 1.1.3 or 1.1.4 to draw a graph with your calculator. Whenever you draw a graph, you have the option of manually changing the view or having the calculator automatically find a view of the graph.

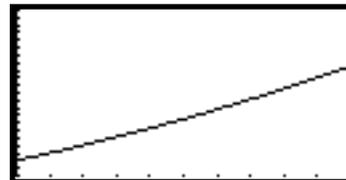

**1.1.3 MANUALLY CHANGING THE VIEW OF A GRAPH** If you do not have a good view of the graph or if you do not see the graph, change the view with one of the ZOOM options or manually set the view. (We later discuss the ZOOM options.)

<p><b>TI 85</b> Press <b>GRAPH</b> <b>F2</b> (RANGE).</p> <p>Set xMin to 0, xMax to 10, leave xScl at 1, set yMin to 900, yMax to 2000, and yScl to 50.</p>	
<p><b>TI 86</b> Press <b>GRAPH</b> <b>F2</b> (WIND).</p> <p>Set xMin to 0, xMax to 10, leave xScl at 1, set yMin to 900, yMax to 2000, and yScl to 50.</p> <p>Below yScl is a setting called xRes. For all applications in this <i>Guide</i>, have xRes set to 1.</p>	

**Both** Press **F5** (GRAPH) to draw the graph of

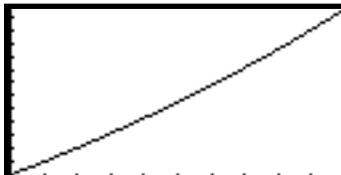

$$y1 = 1000(1 + 0.05^x)$$

in the new view. **CLEAR** removes the menu from the bottom of the screen if you wish to see more of the graph.

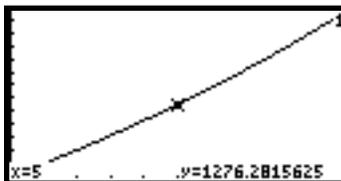

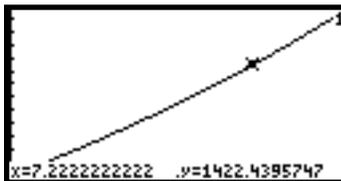

**1.1.4 AUTOMATICALLY CHANGING THE VIEW OF THE GRAPH** If your view of the graph is not good or if you do not see the graph, change the view using the built-in autoscaling feature of your calculator. This option will automatically find a view to see all the functions that you have turned on in the graphing list.

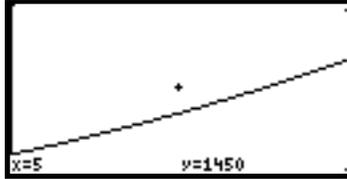

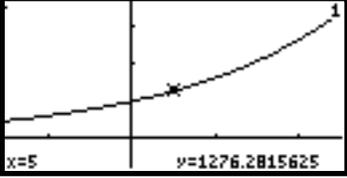

Be sure the function you are graphing,  $y = 1000(1 + 0.05)^x$ , is entered in the y1 location of the y(x)= list. (Delete all other functions that may be entered in other locations.) Before doing what follows, access the graphics menu with **GRAPH**.

<p>To access the range on the TI-85 (called the <i>window</i> on the TI-86), press <b>F2</b>. Set xMin to 0 and xMax to 10. (It does not matter what values are set in the yMin and yMax positions.) Press <b>F3</b> (ZOOM) <b>MORE</b> <b>F1</b> (ZFIT).</p>	
<p>Your calculator automatically sets a vertical view (based on the xMin and xMax you set) and draws a graph of the function.</p>	

**1.1.5 TRACING** You can display the coordinates of certain points on the graph by tracing. The x-values shown when you trace depend on the horizontal view that you choose, and the y-values are calculated by substituting the x-values into the equation that is being graphed.

<p>With the graph on the screen, press <b>F4</b> (TRACE) and use <b>▶</b> to move the trace cursor to the right and <b>◀</b> to move the trace cursor to the left.</p> <p>The number 1 in the upper right hand corner of the screen tells you that you are tracing on the equation in y1.</p>	
<p>Trace past the edge of the screen and notice that even though you cannot see the trace cursor, x and y values of points on the line are still displayed at the bottom of the screen. Also notice that the graph scrolls to the left or right as you move the cursor past the edge of the current viewing screen.</p>	

**1.1.6 ESTIMATING OUTPUTS** You can estimate outputs from the graph using TRACE. It is important to realize that such outputs are *never* exact values unless the displayed x-value is *identically* the same as the value of the input variable.

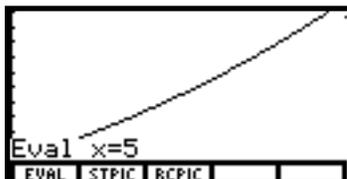

<p>Estimate the value of <math>A</math> where <math>A = 1000(1 + 0.05)^x</math> when <math>x = 5</math>, <math>x = 7</math>, and <math>x = 10</math>.</p> <p>Press <b>EXIT</b> <b>F2</b> (RANGE) (or WINDOW) . If you do not have the settings shown to the right, reset the values.</p>	
<p>Press <b>F3</b> (ZOOM) <b>F3</b> (ZOUT) . After the graph finishes drawing, press <b>ENTER</b> to once more enlarge your view of the graph.</p> <p>(Press <b>EXIT</b> <b>F2</b> (RANGE) and observe the values now defining the graphics screen.)</p>	 <p>Note that (5, 1450) is a point on the screen, <i>not</i> a point on the graph of the function.</p>
<p>Press <b>F4</b> (TRACE) and use <b>▶</b> to move as close as you can to <math>x = 5</math>. (Your screen may look slightly different than the one shown to the right.)</p> <p>Continue pressing <b>▶</b> and notice that the values 7 and 10 cannot be obtained by tracing in this view. Therefore, choose values close to these numbers to obtain <i>estimates</i> such as <math>A</math> is approximately \$1386.80 when <math>x = 7</math> and <math>A</math> is about \$1637.37 when <math>x = 10</math>.</p>	 <p>Because the number 5, <i>not</i> a value close to 5 is shown, <math>A = \\$1276.28</math> when <math>x = 5</math>.</p>

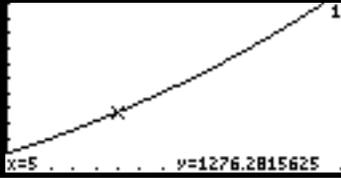

- If you had used the original range (window) with  $xMax = 10$ , and traced, you should obtain the *exact* value  $A = 1500$  when  $x = 10$  because 10, not a value close to 10, is shown when tracing.
- If you want “nice, friendly” values displayed for  $x$  when tracing, set  $xMin$  and  $xMax$  so that  $xMax - xMin$  is a multiple of 12.6, the width of the ZDECM viewing screen. For instance, if you set  $xMin = 0$  and  $xMax = 12.6$  in the example above, the *exact* values when  $x = 5$ ,  $x = 7$ , and  $x = 10$  are displayed when you trace. Another view that gives friendly values is  $xMin = -5$  and  $xMax = 20.2$  since  $25.2 = 2(12.6)$ . Try it!

**1.1.7 EVALUATING OUTPUTS** The values obtained by this evaluation process are *actual* output values of the equation, not estimated values such as those generally obtained by tracing.

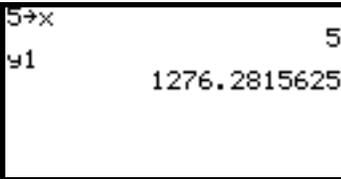

Begin by entering the equation whose output you want to evaluate in the  $y(x)=$  list. Even though you can use any of the locations, let us say for this illustration you have  $y1 = 1000(1 + 0.05^x)$ .

**To evaluate an output while the graph is on the screen:**

<p>Draw the graph of <math>y1</math> in a view containing the input you intend to use. (If the input value is not between <math>xMin</math> and <math>xMax</math>, an error message results when you evaluate.)</p> <p>Press <b>MORE</b> <b>MORE</b> <b>F1</b> (EVAL), and type the input value.</p>	
--	---

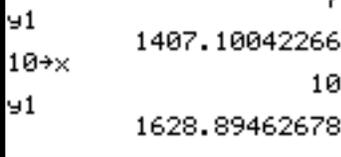

<p>Press <b>ENTER</b> to display the output and see the point marked on the graph of the function.</p> <p>Repeat this process to find the outputs when <math>x = 7</math> and <math>x = 10</math>.</p>	
--	---

**To evaluate an output from the home screen:**

<p>First, press <b>EXIT</b> until you are on the home screen. Store the input value, say 5, in <math>x</math> by with <b>STO</b> <b>x-VAR</b> <b>ENTER</b>.</p> <p>Next, type the location in the <math>y(x)=</math> list in which the function is stored with <b>2nd</b> <b>ALPHA</b> <b>0</b> (y) 1. Note that the second function key is pressed before typing the letter <math>y</math> in order to type lower-case <math>y</math>.</p>	
---	---

**Warning:** The TI-85 and the TI-86 distinguish between lower-case and upper-case variable names. Locations in which equations are stored in the graphing list are always referred to with *lower-case* letters.

<p>If you had not pressed <b>2nd</b> before <b>ALPHA</b> and therefore entered <math>Y1</math>, you would be using another variable stored in the calculator's memory. (Your values may be different from the ones shown to the right or you may get an UNDEFINED error.)</p> <p>Note that on the TI-85, <math>y1(5)</math> multiplies <math>y1</math> by 5.</p>	
--	--

<p>To evaluate another output, simply store the input value in <math>x</math>, type <math>y1</math> and press <b>ENTER</b>.</p> <p>Evaluate <math>y1 = 1000(1 + 0.05^x)</math> at <math>x = 7</math> and <math>x = 10</math>.</p>	
---	---

- The values obtained by either of these evaluation processes are *actual* output values of the equation, not *estimated* values such as those generally obtained by tracing.

**TI-86: Evaluating outputs from the home screen** While the evaluation process indicated above works on the TI-86, advances in the TI-86 technology give you a way to evaluate functions from the home screen using fewer keystrokes than for the TI-85.

<p>Type <b>2nd</b> <b>ALPHA</b> <b>0</b> (y) 1 and then press <b>(</b> <b>5</b> <b>)</b>. Press <b>ENTER</b>.</p> <p>On the TI-86, typing a value in parentheses following a function evaluates the function at that input value.</p>	
---	--

<p>Evaluate <math>y_1</math> at <math>x = 7</math> by recalling the previous entry with <b>2nd</b> <b>ENTER</b> (ENTRY), edit the 5 to 7 by pressing <b>◀</b> <b>◀</b> and typing over the 5, and press <b>ENTER</b>.</p> <p>Repeat the process to evaluate <math>y_1</math> at <math>x = 10</math>.</p>	
--	--

## 1.2 Functions and Graphs

When you are asked to *estimate* or *approximate* an output or an input value, you can use your calculator in the following ways:

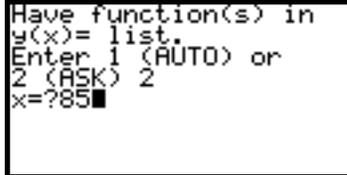

- tracing a graph (Sections 1.1.5, 1.1.6)
- close values obtained from a table of function values (End of Section 1.2.2)

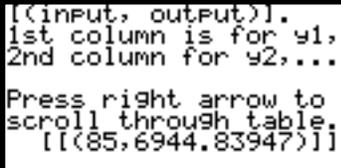

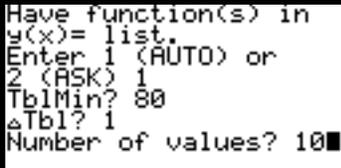

When you are asked to *find* or *determine* an output or an input value, you should use your calculator in the following ways:

- evaluating an output on the home screen (Section 1.1.7)
- find a value using the AUTO or ASK features of the table (Section 1.2.1)
- determine an input using the solver (Section 1.2.2)

**1.2.1 DETERMINING OUTPUTS** Function outputs can be determined by evaluating on the home screen, as discussed in 1.1.7. You can also evaluate functions using the calculator's TABLE. (On the TI-85, the table is accessed with program TABLE.) When you use the table, you can ask for specific output values corresponding to the inputs you enter or generate a list of input values that begin with  $Tb|Min$  and differ by  $\Delta Tbl$  and their corresponding outputs.

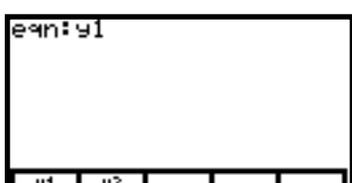

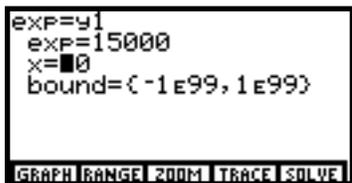

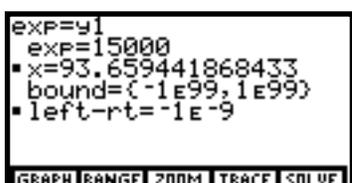

Let's use the TABLE to determine the output of the function  $v(t) = 3.622(1.093)^t$  when  $t = 85$ . Press **GRAPH** **F1** ( $y(x)=$ ), clear any functions, and enter  $3.622(1.093)^X$  in location  $y_1$ . Exit.

<p><b>TI-85</b> Note that when using program TABLE, any functions you want to evaluate should be in locations <math>y_1, y_2</math>, and so forth. That is, don't leave an empty function location in the <math>y(x)=</math> list. (Program TABLE can be found in the TI-85/86 Appendix.)</p> <p>An alphabetical list of the programs that you have entered in your TI-85 appears on the bottom menu.</p>	<p>Press <b>PRGM</b> and then press <b>F1</b> (NAMES).</p> 
<p>Find the name TABLE (press <b>MORE</b> if necessary). Press the F-key corresponding to the location of the program and <b>ENTER</b> to "run" the program.</p> <p>Since we only want <math>v(85)</math>, enter 2 for ASK and type 85 at the <math>x=?</math> prompt.</p>	

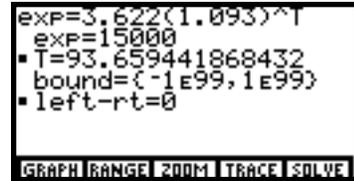

<p>The message that appears tells you to press <b>ENTER</b> to see the output.</p> <p>The output is in the form <math>[ t, v(t) ]</math>. We see that <math>v(85) \approx \\$6945</math>.</p>	
<p>If you had wanted to generate a list of values, starting at a value called <b>TblMin</b> and differing by <math>\Delta Tbl</math>, use the <b>AUTO</b> option in the program.</p> <p>Press <b>ENTER</b> to re-run the program, choose 1 for <b>AUTO</b>, and enter the values like those shown to the right.</p>	
<p>Pressing <b>ENTER</b> and <b>▼</b> allows you to see the outputs that have been generated and their corresponding inputs. (If you had evaluated several different functions, their outputs appear in the same order (horizontally) as the functions in the graphing list.)</p>	
<p><b>TI-86</b> After entering the function <math>v(t)</math> in <b>y1</b>, choose the <b>TABLE SETUP</b> menu.</p>	<p>Press <b>TABLE</b> <b>F2</b> (<b>TBLST</b>).</p>
<p>To generate a list of values beginning with 80 with the table values differing by 1, enter 80 in the <b>TblStart</b> location, 1 in the <math>\Delta Tbl</math> location, and choose <b>AUTO</b> in the <b>Indpnt:</b> location.</p> <p>Remember that you “choose” a particular setting by positioning the blinking cursor over that setting and pressing <b>ENTER</b>.</p>	
<p>Press <b>F1</b> (<b>TABLE</b>), and observe the list of input and output values. Notice that you can scroll through the table with <b>▼</b>, <b>▶</b>, <b>▲</b>, and/or <b>◀</b>.</p> <p>The table values may be rounded in the table display. You can see more of the output by moving to the value and looking at the bottom of the screen.</p>	
<p>Return to the <b>TABLE SETUP</b> menu with <b>F1</b> (<b>TBLST</b>). (<b>TblSet</b>). To compute specific outputs rather than a list of values, choose <b>ASK</b> in the <b>Indpnt:</b> location. (When using <b>ASK</b>, the settings for <b>TblMin</b> and <math>\Delta Tbl</math> do not matter.)</p>	

<p>Press <b>F1</b> (TABLE), type in the <math>x</math>-value(s) at which the function is to be evaluated, and press <b>ENTER</b>.</p> <p>You can scroll through the table with <b>▼</b>, <b>▶</b>, <b>▲</b>, and/or <b>◀</b>. Unwanted input entries can be cleared with <b>DEL</b>.</p>	$v(85) \approx \$6945$
--	------------------------

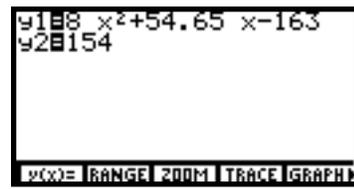

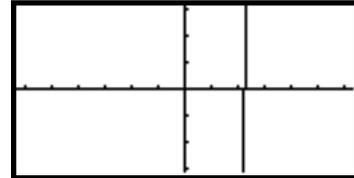

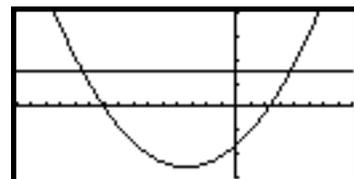

**1.2.2 SOLVING FOR INPUT VALUES** Your calculator will solve for input values of an equation that you enter in the SOLVER. You can use any letter you wish for the input variable when using the SOLVER. (Of course, if you are using a function that is entered in the graphing list, the input variable is  $x$ .) You can even enter an equation consisting of several variables! You should find your calculator's solver a very valuable tool.

<p>Press <b>2nd</b> <b>GRAPH</b> (SOLVER) to access the SOLVER.</p> <p>If there is already an equation in the solver, clear it with <b>CLEAR</b>. You may need to press <b>▲</b> to get to the screen shown on the right before you can clear the old expression.</p>	
<p>You can access a function stored in another location, such as our current <math>y1 = 3.622(1.093)^X</math>, by pressing the F-key corresponding to the equation or you can type in a new equation.</p> <p>Suppose we want to solve <math>v(t) = 3.622(1.093)^t</math> for <math>t</math> when <math>v = \\$15,000</math>.</p>	
<p>Press <b>ENTER</b> and you will see the last values the calculator used for <math>y1</math> and <math>x</math>. Enter 15,000 for <math>y1</math>.</p> <p>Use <b>▼</b> and/or <b>▲</b> to move between locations in the SOLVER.) The displayed bound gives the values between which your calculator will look for a solution to the equation -- just leave the bound<sup>1</sup> as it is.</p>	
<p>Position the blinking cursor on the row corresponding to the variable for which you want to solve and press <b>F5</b> (SOLVE).</p> <p>The left side of the equation, <math>y1</math>, evaluated at <math>x \approx 93.66</math> and the right side of the equation, 15,000, are subtracted and displayed in the <i>left-rt</i> row. When this value is 0, an <i>exact</i> solution (rather than a rounded one) was found.</p>	

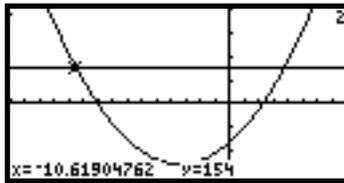

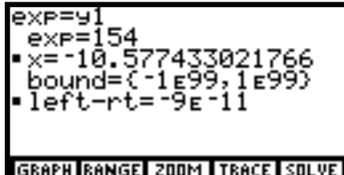

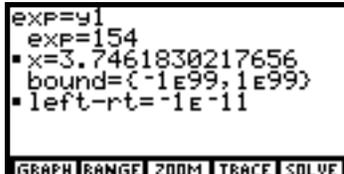

<sup>1</sup>It is possible to change the bound and/or the tolerance if the calculator has trouble finding a solution to a particular equation. This, however, should not usually happen. Refer to your *Owner's Manual* for details.

<p>Notice that you could have typed the <math>v(t)</math>, with input variable <math>t</math>, directly in the solver. The solution is, of course, the same.</p>	
--	---

If there is more than one solution to an equation, you need to give the solver an approximate location for each answer. Suppose you are given  $q(x) = 8x^2 + 54.65x - 163$  and asked to find what input(s) correspond to an output of  $q(x) = 154$ . (The procedure outlined below also applies to finding where two functions are equal.)

<p>Enter <math>8x^2 + 54.65x - 163</math> in one location, say <math>y_1</math>, and 154 in another location, say <math>y_2</math>, in the <math>y(x)=</math> list.</p> <p>(Remember that if the input variable in the equation is not <math>x</math>, you must rewrite the equation in terms of <math>x</math> to graph using the <math>y(x)=</math> list.)</p>	
<p>To better obtain a guess as to where <math>y_1</math> equals (intersects) <math>y_2</math>, graph the equations.</p> <p>If you are not told where you want to view the graph, begin by pressing <b>GRAPH</b> <b>F3</b> (ZOOM) <b>F4</b> (ZSTD) or</p>	
<p><b>GRAPH</b> <b>F3</b> (ZOOM) <b>MORE</b> <b>F4</b> (ZDECM) .</p> <p>You want to see a "good" graph, that is, one that shows all the important features. In this case, the important features are where <math>y_1</math> and <math>y_2</math> intersect.</p> <p>Neither this graph nor the previous one is a good graph for viewing the intersections.</p>	
<p>To improve the view, use <b>EXIT</b> <b>F2</b> (RANGE or WIND) * and change to <math>xMin = -15</math>, <math>xMax = 8</math>, <math>yMin = -300</math>, and <math>yMax = 400</math> . Draw the graph with <b>F3</b> (GRAPH) .</p> <p>(There are many other windows that work just as well as the one shown to the right. Also, instead of setting a window manually, you could draw the graph with ZFIT in the ZOOM menu.)</p>	

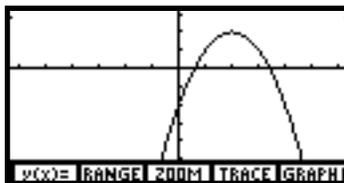

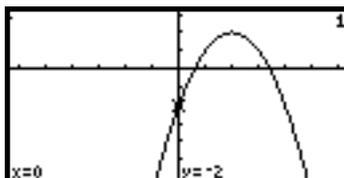

\*The current settings for the graphics screen are obtained with **GRAPH** **F2** (RANGE) on the TI-85 and with **GRAPH** **F2** (WIND) on the TI-86. When the screen appears, the word RANGE is at the top of the TI-85 screen and the word WINDOW is at the top of the TI-86 screen. Because the only difference in the calculators in this situation is the name that is used, we from this point forward refer to this key for both calculators as **F2** (RANGE or WIND) . In such cases, the screen shown in the right column will be the one from the TI-85.

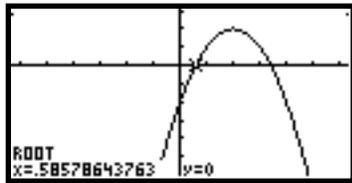

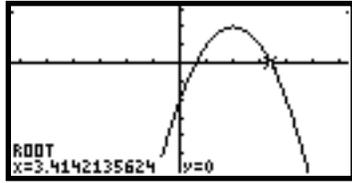

<p>Press <b>F4</b> (TRACE) and use <b>▶</b> and/or <b>◀</b> to move along the graph of the equation in <math>y1</math>.</p> <p>Press <b>▼</b> to jump from the graph of <math>y1</math> to the graph of <math>y2</math>. Tracing reveals that guesses for the input values where these two graphs intersect are <math>x \approx -10.6</math>, <math>x \approx 3.8</math>.</p> <p>Return to the home screen with <b>2nd</b> <b>EXIT</b> (QUIT).</p>	
<p>Access the SOLVER and enter the equation <math>y1 = y2</math> as shown on the right. Enter the guess for the leftmost intersection point and solve for <math>x</math>.</p>	
<p>Enter the guess for the rightmost intersection point and solve for <math>x</math>.</p> <p>The two solutions to the equation, reported to four decimal places, are <math>x = -10.5774</math> and <math>x = 3.7462</math>.</p>	

**1.2.3 GRAPHICALLY FINDING INTERCEPTS** Finding where a function graph crosses the vertical and horizontal axis can be done graphically as well as by the methods indicated in 1.2.2 of this *Guide*. Remember the process by which we find intercepts:

- To find the  $y$ -intercept of a function  $y = f(x)$ , set  $x=0$  and solve the resulting equation.
- To find the  $x$ -intercept of a function  $y = f(x)$ , set  $y=0$  and solve the resulting equation.

Also remember that an  $x$ -intercept of a function  $y = f(x)$  has the same value as the root or solution of the equation  $f(x) = 0$ .

<p>Clear all locations in the <math>y(x)=</math> list and enter in <math>y1</math> <math>f(x) = 4x - x^2 - 2</math>.</p> <p>Draw a graph with <b>F3</b> (ZOOM) <b>MORE</b> <b>F4</b> (ZDECM). Press <b>F2</b> (RANGE or WIND) and reset <math>yMin</math> to <math>-6</math> for a good view of all intercepts. Press <b>F5</b> (GRAPH).</p>	
<p>Even though it is very easy to find <math>f(0) = -2</math>, you can have the calculator find the <math>y</math>-intercept while viewing the graph by pressing</p> <p>TI-85 <b>MORE</b> <b>F1</b> (MATH) <b>MORE</b> <b>F4</b> (YICPT)</p> <p>TI-86 <b>MORE</b> <b>F1</b> (MATH) <b>MORE</b> <b>F2</b> (YICPT)</p> <p><b>Both</b> View the <math>y</math>-intercept <math>f(0) = -2</math>.</p>	

<p>To graphically find an <math>x</math>-intercept, i.e., a value of <math>x</math> at which the graph crosses the horizontal axis, first press <b>EXIT</b> to return the menu to the bottom of the screen.</p> <p><b>TI-85</b> Press <b>F1</b> (MATH) <b>F3</b> (ROOT)</p> <p><b>TI-86</b> Press <b>F1</b> (MATH) <b>F1</b> (ROOT)</p> <p><b>Both</b> Use <b>▶</b> to move the trace cursor near the first <math>x</math>-intercept, and press <b>ENTER</b>.</p>	
<p>To find the second <math>x</math>-intercept, press <b>EXIT</b> and the F-key under ROOT, use <b>▶</b> to move the trace cursor near the other <math>x</math>-intercept, and press <b>ENTER</b>.</p>	

### 1.3 Constructed Functions

Your calculator can find output values of and graph combinations of functions in the same way that you do these things for a single function. The only additional information you need is how to enter constructed functions in the graphing list. Suppose that a function  $f(x)$  has been entered in  $y_1$  and a function  $g(x)$  has been entered in  $y_2$ .

- Enter  $y_1 + y_2$  in  $y_3$  to obtain the sum function  $(f+g)(x) = f(x) + g(x)$ .
- Enter  $y_1 - y_2$  in  $y_4$  to obtain the sum function  $(f-g)(x) = f(x) - g(x)$ .
- Enter  $y_1 * y_2$  in  $y_5$  to obtain the product function  $(f \cdot g)(x) = f(x) * g(x)$ .
- Enter  $y_1 / y_2$  in  $y_6$  to obtain the quotient function  $(f \div g)(x) = \frac{f(x)}{g(x)}$ .

**On the TI-85,**

- The TI-85 interprets  $y1(y2)$  as the *product* of  $y1$  and  $y2$ . To have the calculator graph the composite function  $f(g(x))$ , you should substitute  $g(x)$  everywhere an  $x$  appears in  $f(x)$ . For instance, if  $f(x) = x^2 - 1$  is in  $y1$  and  $g(x) = 0.3x + 5$  is in  $y2$ , enter  $y7 = y2^2 - 1$  for the composite function  $(f \circ g)(x)$ .

**On the TI-86,**

- Enter  $y1(y2)$  in  $y7$  to obtain the composite function  $(f \circ g)(x) = f(g(x))$ .

**Both** Your calculator will evaluate and graph these constructed functions. Although it will not give you an algebraic formula for a constructed function, you can check your algebra by evaluating the calculator-constructed function and your constructed function at several different points. (You will very likely have to reset the horizontal and vertical views when graphing constructed functions.)

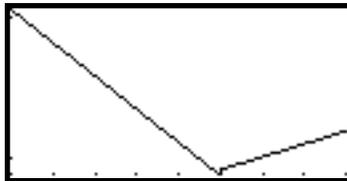

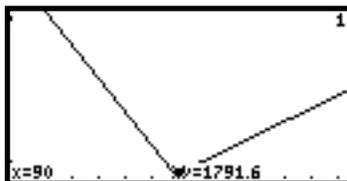

### 1.3.1 GRAPHING PIECEWISE CONTINUOUS FUNCTIONS

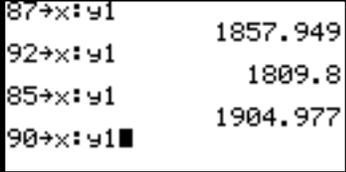

Piecewise continuous functions are used throughout the text. It is often helpful to use your calculator to graph and evaluate outputs of piecewise continuous functions. Consider the following example.

The population of West Virginia from 1985 through 1993 can be modeled by

$$P(t) = \begin{cases} -23.514t + 3903.667 & \text{thousand people when } 85 \leq t < 90 \\ 9.1t + 972.6 & \text{thousand people when } 90 \leq t \leq 93 \end{cases}$$

where  $t$  is the number of years since 1900.

<p>Enter the function <math>P(t)</math>, using <math>x</math> as the input variable, in the <math>y1</math> location of the <math>y(x)=</math> list using the keystrokes</p> <p>( ( (-) 23.514 [x-VAR] (+) 3903.667 ) ( ( [x-VAR] [2nd] [2] (TEST) [F2] (&lt;) 90 ) (+) ( ( 9.1 [x-VAR] (+) 972.6 ) ( ( [x-VAR] [F5] (&gt;=) 90 ) ) .</p>	 <p>Each piece of the function and its corresponding input must be enclosed in parentheses.</p>
<p>Notice that the function is defined only when the input is between 85 and 93. You could find <math>P(85)</math> and <math>P(93)</math> to help you set the vertical view. However, we choose to let the calculator set the vertical view.</p> <p>Set the horizontal view <math>xMin = 85</math> and <math>xMax = 93</math>. Press [GRAPH] [F3] [MORE] [F1] [ZOOM] (ZFIT) to graph <math>P(x)</math>.</p>	
<p>If you wish to see the “break” in the function where the two pieces join, the width of the screen must be a multiple of 12.6 and include 90.</p> <p>Since <math>90 - 0.5(12.6) = 83.7</math> and <math>90 + 0.5(12.6) = 96.3</math>, change <math>xMin</math> and <math>xMax</math> to these values. Press [F5] (GRAPH).</p>	

<p>Because the two pieces are close together at <math>x = 90</math>, you may need to take a closer look to see the break. However, because the calculator draws graphs by connecting function outputs wherever the function is defined, it will connect the two pieces unless you tell it not to do so by pressing <b>MORE</b> <b>F5</b> (FORMAT), use <b>▼</b> and <b>▶</b> to choose DrawDot. Press <b>ENTER</b>.</p>	
<p>Now, take a closer look with <b>F5</b> (GRAPH) and <b>F3</b> <b>ZOOM</b> <b>F2</b> (ZIN).</p> <p>To keep the point where the functions break in view, use <b>▼</b> to move the small cursor that appears in the middle of the screen down to where the two functions join before pressing <b>ENTER</b> to actually zoom in.</p>	 <p>The breaks you see in the left portion of the function are because you are in dot mode.</p>
<p><b>TI-85</b> You can find function values by evaluating outputs on the home screen or using the table.</p> <p>Do not forget to change the calculator's FORMAT setting back to DrawLine when you finish graphing the piecewise function.</p>	
<p><b>TI-86</b> The same procedure as given in the above steps will also work for the TI-86. However, the TI-86 has some additional features that make graphing of piecewise functions less complicated.</p>	<p>(See Section 6.1.2 of this <i>Guide</i> for an example showing how to fit a piecewise model to data.)</p>
<p>Instead of going to the <b>FORMAT</b> menu, use the following to choose DrawDot.</p> <p>Have the cursor on the <math>y_1</math> line, press <b>EXIT</b> until you return to the graph menu, and then press <b>F1</b> (<math>y(x)=</math>) <b>MORE</b> <b>F3</b> (STYLE). Press <b>F3</b> five more times to choose the dotted line<sup>2</sup> to the left of <math>y_1</math>.</p> <p>The dotted line you now see to the left of <math>y_1</math> indicates the graph will draw without joining the outputs of the function.</p>	

<sup>2</sup>The different "graph styles" you can draw from this location are described in more detail on page 10 in your TI-86 Graphing Calculator Guidebook.

After setting the proper horizontal view, you can now use ZFIT to draw a graph of the piecewise function.	
You can find function values by evaluating outputs on the home screen or using the table.	

## 1.4 Linear Functions and Models

Actual real-world data is used throughout *Calculus Concepts*. It is necessary that you use your calculator to find a curve that models the data. Be very careful when you enter the data in your calculator because your model and all of your results depend on the values that you enter!

**1.4.1 ENTERING DATA** There are several ways to input data in your calculator. Two of these, entering data from the home screen and entering data using the list editor, are discussed below. If you do not see the list names L1 and L2 return to the statistical setup instructions at the beginning of this *Guide*.

We will explore data entry with the following data:

<i>Year</i>	1992	1993	1994	1995	1996	1997
<i>Tax</i>	2541	3081	3615	4157	4703	5242

<p><b>To enter data from the home screen,</b></p> <p>Return to the home screen with <b>2nd</b> <b>EXIT</b> (QUIT) .</p> <p>Press <b>2nd</b> <b>[-]</b> (LIST) , press <b>F1</b> (I) to begin the list, type in each of the <math>x</math>-data values separated by commas, and end the list with <b>F2</b> (I) .</p> <p>Store this list to the name with L1 with <b>STO</b> <b>L</b> <b>ALPHA</b> 1 <b>ENTER</b> .</p>	
--	--

<p><b>To enter data using the list editor,</b></p> <p>Press <math>\boxed{2\text{nd}} \boxed{\text{[ ]}}</math> (LIST) <math>\boxed{\text{F4}}</math> (EDIT) to access the list editor. Enter the name L2 at the name prompt and press <math>\boxed{\text{ENTER}}</math>.</p> <p>Enter the first <math>y</math>-value as <math>e_1</math>, press <math>\boxed{\text{ENTER}}</math> or <math>\boxed{\blacktriangledown}</math>, enter the second <math>y</math>-value as <math>e_2</math>, etc.</p>	 <p>If there are data values in this list, see 1.4.3 of this <i>Guide</i> and first delete the "old" data.</p>
<p><b>TI-86</b> Even though both of the methods discussed above are ways to enter data on the TI-86, the most convenient method is to enter the data in the TI-86's stat lists. Return to the home screen and press <math>\boxed{2\text{nd}} \boxed{+}</math> (STAT) <math>\boxed{\text{F2}}</math> (EDIT). Go to Section 1.4.3 of this <i>Guide</i>, delete the data currently in these lists, and enter the data again using the method described next.</p>	
<p>Position the cursor in the first location in list L1. Enter the <math>x</math>-data into list L1 by typing the numbers from top to bottom in the L1 column, pressing <math>\boxed{\text{ENTER}}</math> after each entry.</p> <p>After typing the L1(s) value, 1997, use <math>\boxed{\blacktriangleright}</math> to go to the top of list L2. Enter the <math>y</math>-data into list L2 by typing the entries from top to bottom in the L2 column, pressing <math>\boxed{\text{ENTER}}</math> after each entry.</p>	

**1.4.2 EDITING DATA IN THE TI-85 LIST EDITOR** If you incorrectly type a data value, access the data with the list editor and use the cursor keys to move to the value you wish to correct. Type the correct value and press  $\boxed{\text{ENTER}}$ .

- To *insert* a data value, put the cursor over the value that will be directly below the one you will insert, and press  $\boxed{\text{F1}}$  (INSi). The values in the list below the insertion point move down one location and a 0 is filled in at the insertion point. Type the data value to be inserted and press  $\boxed{\text{ENTER}}$ . The 0 is replaced with the new value.
- To *delete* a single data value, move the cursor to the value you wish to delete, and press  $\boxed{\text{F2}}$  (DELi). The values in the list below the deleted value move up one location.

**1.4.2 EDITING DATA IN THE TI-86 STAT LISTS** If you incorrectly type a data value, use the cursor keys to darken the value you wish to correct and type the correct value. Press  $\boxed{\text{ENTER}}$ .

- To *insert* a data value, put the cursor over the value that will be directly below the one you will insert, and press  $\boxed{2\text{nd}} \boxed{\text{DEL}}$  (INS). The values in the list below the insertion point

move down one location and a 0 is filled in at the insertion point. Type the data value to be inserted over the 0 and press **ENTER**. The 0 is replaced with the new value.

- To *delete* a single data value, move the cursor over the value you wish to delete, and press **DEL**. The values in the list below the deleted value move up one location.

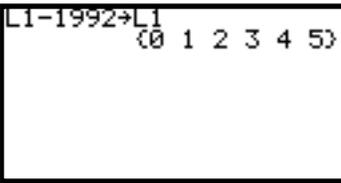

### 1.4.3 DELETING OLD DATA

Whenever you enter new data in your calculator, you should first delete any previously-entered data. There are several ways to do this, and the most convenient method is illustrated below.

<p><b>TI-85</b> Whenever you enter new data in your calculator, you should first delete any previously-entered data using one of the following methods:</p> <ul style="list-style-type: none"> <li>• Whenever you enter data from the home screen, previously-entered data is automatically replaced with new data. Thus, {1, 2, 3} <b>STO</b> L2 replaces the “old” L2.</li> <li>• When you enter the list editor and there is “old” data in the list, position the cursor over the e1 value and repeatedly press <b>F2</b> (DEL) until all data is deleted.</li> </ul>	
<p><b>TI-86</b> Access the data lists with <b>STAT</b> <b>1</b> (EDIT). (You probably have different values in your lists if you are deleting “old” data.)</p> <p>Use <b>▲</b> to move the cursor over the name L1.</p>	
<p>Press <b>CLEAR</b> <b>ENTER</b>.</p>	
<p>Use <b>▶</b> <b>▲</b> to move the cursor over the name L2. Press <b>CLEAR</b> <b>ENTER</b>.</p> <p>Repeat this procedure to clear data from any of the other lists you want to use.</p>	

### 1.4.4 ALIGNING DATA

Let’s now return to the data entered in Section 1.4.1 of this *Guide*. Suppose you want L1 to contain the number of years since a certain year (here, 1992) instead of actual years. That is, you want to *align* the *x*-data. In this example, you are to shift all the data values 1992 units to the left of where they currently are located.

<p>Return to the home screen.</p> <p><b>TI-85</b> Replace the L1 values with L1 – 1992 values by pressing <b>ALPHA</b> L1 <b>–</b> 1992 <b>STO</b> L <b>ALPHA</b> 1 <b>ENTER</b>. L1 now contains the aligned <i>x</i>-values.</p>	
--	---

<p><b>TI-86</b> Position the cursor over the L1 at the top of the first column.</p> <p>Replace the L1 values with L1 – 1992 values by pressing <b>F3</b> (NAMES), the menu key under L1, and then press <b>[-]</b> 1992 <b>ENTER</b>.</p> <p>Instead of an actual year, the input now represents the number of years after 1992.</p>	
--	--

**1.4.5 PLOTTING DATA** Any functions you have in the  $y(x)=$  list will graph when you plot data. Therefore, you should delete them or turn them off before drawing a scatter plot.

<p>Access the <math>y(x)=</math> graphing list. If any entered function is no longer needed, delete it with <b>F4</b> (DELf) or clear it with <b>CLEAR</b>.</p> <p>If you want the function to remain but do not want it to graph, position the cursor in that function location and press <b>F5</b> (SELCT).</p>	 <p>A "turned off" function.</p>
---	---

**To graph data on the TI-85:**

The TI-85 command Scatter L1, L2 draws a scatter plot of L1 versus L1. However, you must set an appropriate RANGE before using this command. Program STPLT found in the TI-85/TI-86 Appendix automates this task.

<p>Press <b>PRGM</b> and then press <b>F1</b> (NAMES).</p> <p>Find the name STPLT (press <b>MORE</b> if necessary).</p>	<p>Press the F-key corresponding to the location of STPLT to run the program.</p>
<p>Press <b>CLEAR</b> to remove the menu from the bottom of the screen for a better view.</p> <p>A scatter plot is drawn of the data with the L1 data as the input data and the L2 data as the output data.</p>	

- Program STPLT sets the  $x$  and  $y$ -axis tick marks to 0 so they do not interfere with your view of the scatter plot.
- Because the dots the calculator uses to plot data are sometimes difficult to see when overdrawing the model of best fit, the program places a small box around each data point. (The boxes may appear a slightly different size with different screen settings.)
- Even though the TI-85 generally allows you to call lists by any names you want, *you must enter the input data in the list named L1 and the output data in the list named L2* when using program STPLT.
- Lists L1 and L2 must be of the same length or an error message results.
- It is not possible to trace a scatter plot drawn on the TI-85.

### To graph data on the TI-86:

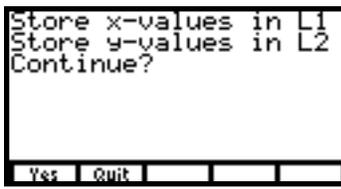

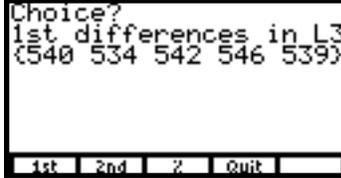

The TI-86 has a built-in command to graph data and autoscale the data window.

<p>Press <b>2nd</b> <b>+</b> (STAT) <b>F3</b> (PLOT) to display the STAT PLOTS screen. (Your screen may not look exactly like this one.)</p> <p>Note: When drawing a graph from the <math>y(x)=</math> list, you may get an error message or see a scatter plot of “old” data as well as the function graph. If so, turn off the STAT PLOTS with <b>F5</b> (PIOff) <b>ENTER</b> .</p>	
<p>On the STAT PLOTS screen, press <b>F1</b> (PLOT1) to display the Plot1 screen, press <b>ENTER</b> to turn Plot1 “On”, press <b>▼</b> <b>F1</b> (SCAT) <b>▼</b>. Press the menu key under list L1. Press <b>▼</b> and the menu key under list L2.</p> <p>Press <b>▼</b> and press the menu key corresponding to the mark. You can choose any of the three marks at the bottom of the screen.</p>	<p>You can enter the names of any lists. However, it is easiest to always work with L1 and L2.</p>
<p>Press <b>EXIT</b> until you return to the home screen. Go to the graph menu and clear the <math>y(x)=</math> list . To have the TI-86 set an autoscaled view of the data and draw the scatter plot, press <b>GRAPH</b> <b>F3</b> (ZOOM) <b>MORE</b> <b>F5</b> (ZDATA) .</p> <p>(ZDATA does not reset the <math>x</math> and <math>y</math>-axis tick marks. You should do this manually with RANGE or WIND if you want different spacing between the marks.)</p>	<p>You can trace the scatter plot with the TRACE key.</p>
<p>Press <b>GRAPH</b> and access the function list. Notice that “Plot1” at the top of the screen is now dark. This is because you have turned Plot1 “on”. If you always put input data in list L1 and output data in list L2, you can turn the scatter plot off and on from the <math>y(x)=</math> screen rather than the stat plots screen from this point on.</p> <p>To turn Plot1 off, use <b>▲</b> to move the cursor to the Plot1 position, and press <b>ENTER</b> . Reverse the process to turn Plot1 back on.</p>	<p>A scatter plot is turned <i>on</i> when its name on the <math>y(x)=</math> screen is darkened. Remember that you will have lower-case functions.</p>

- TI-86 lists can be named and stored in the calculator’s memory for later recall and use. If you do this and use the list by its stored name, you must use the name of the list in the stat plot setup or on the stat plot screen each time you change lists. Refer to your *TI-86 Guidebook* for details.

**1.4.6 FINDING FIRST DIFFERENCES** When the input values are evenly spaced, use program DIFF to compute first differences in the output values. If the data are perfectly linear (*i.e.*, every data point falls on the graph of the line), the first differences in the

output values are constant. If the first differences are “close” to constant, this is an indication that a linear model *may* be appropriate.

<p>Program DIFF is given in the TI-85/TI-86 Appendix.</p> <p>To run the program, press <b>PRGM</b> <b>F1</b> (NAMES) and then the F-key under the name of the program. Press <b>ENTER</b> . If you have not entered the data, stop the program by pressing <b>F2</b> (Quit) . To continue, press <b>F1</b> (Yes) .</p>	
<p>At the Choice? prompt, press <b>F1</b> (1st) to generate the list of first differences.</p> <p>Note: You may not be able to see the complete list on this screen. If not, go to the list editor to see the complete list of first differences stored in L3.</p>	
<p>Exit program DIFF with <b>F4</b> (Quit) .</p> <p><b>TI-85</b> View list L3 containing the first differences in the output data by pressing <b>2nd</b> <b>-</b> (LIST) <b>F4</b> (EDIT) <b>F3</b> (L3) <b>ENTER</b> .</p>	
<p><b>TI-86</b> If you do not want to use program DIFF, you can use your TI-86 to compute first differences of any list.</p> <p>Press <b>2nd</b> <b>-</b> (LIST) <b>F5</b> (OPS) <b>MORE</b> <b>MORE</b> <b>F4</b> (Delta()) <b>EXIT</b> <b>F3</b> (NAMES) and the menu key under L2. Press <b>)</b> <b>ENTER</b> to see the list of first differences in the output data.</p>	
<p>If necessary, use <b>▶</b> to scroll to the right to see the remainder of the first differences. Use <b>◀</b> to scroll back to the left.</p> <p>Be certain you have evenly-spaced input values if you are using this to give information about first differences and linear models.</p>	

- **Both** Program DIFF **should not** be used for data with input (L1) values that are *not* evenly spaced. First differences give no information about a possible linear fit to data with inputs that are not the same distance apart.

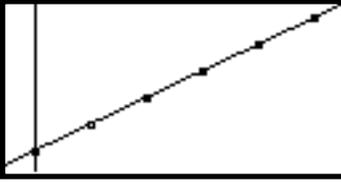

**1.4.7 FINDING A LINEAR MODEL** Use your calculator to obtain the linear model that best fits the data. Your calculator can find two different, but equivalent, forms of the linear model:  $y = ax + b$  or  $y = a + bx$  . For convenience, we always choose the model  $y = ax + b$  .

<p><b>TI-85</b> It is possible to enter data while in the statistics mode of your calculator. However, the examples in this <i>Guide</i> assume that input data is already entered in list L1 and output data is in list L2.</p> <p>Press <b>STAT</b> <b>F1</b> (CALC) and press the F-keys on the menu to enter L1 as the xlist Name and L2 as the ylist Name. Press <b>ENTER</b> after each entry.</p>	
<p>Choose the linear model with <b>F2</b> (LINR).</p>	
<p>The <math>y</math>-intercept, <math>a</math>, and the slope, <math>b</math>, of the model is displayed along with the number, <math>n</math>, of data points. (The <math>\text{corr}</math> that is shown is called the <i>correlation coefficient</i>. It is something you will learn about in a statistics course and should be ignored in this course.)</p>	
<p><b>TI-86</b> Press <b>2nd</b> <b>+</b> (STAT) <b>F1</b> (CALC) <b>F3</b> (LinR).</p> <p>To have the calculator find the linear model of best fit using L1 as the input and L2 as the output <u>and</u> paste the model into the <math>y(x)=</math> list, put the following after the LinReg instruction:</p>	<p>The linear model fit by the TI-86 is of the form</p> $y = a + bx$ <p>where <math>a</math> is the <math>y</math>-intercept and <math>b</math> is the slope. This is equivalent, but not of the same form, as the model in your text.</p>
<p>the input and output list names either by typing them from the keyboard or by pressing <b>2nd</b> <b>-</b> (LIST) <b>F3</b> (NAMES), press the menu key under L1, press <b>i</b>, and press the menu key under L2. Next, type <b>i</b> <math>y1</math>. Press <b>ENTER</b>. (The model will be pasted into the location that you specify.)</p>	
<p>The linear model of best fit for the aligned tax data entered in Section 1.4.4 of this <i>Guide</i> is displayed on the home screen.</p> <p>Note: It is not necessary to first clear any previously-entered function from the location of the <math>y(x)=</math> list.</p>	
<p>(The <math>\text{corr}</math> that is shown is called the <i>correlation coefficient</i>. It is something you will learn about in a statistics course and should be ignored in this course.)</p>	<p>Go the <math>y(x)=</math> list to verify that the model has been pasted into the <math>y1</math> location.</p>

**1.4.8 PASTING A TI-85 MODEL INTO THE FUNCTION LIST** The coefficients of the model found by the calculator should *not* be rounded. This is not a problem because the calculator will paste the entire model into the function list!

<p>TI-85 Press <b>MORE</b> <b>F4</b> (STREG) . At the Name= prompt, type in <math>y_1</math> and press <b>ENTER</b> .</p> <p>Remember that you must use a lower-case <math>y</math> to refer to functions in the <math>y(x)=</math> graphing list.</p> <p>(Any function currently in <math>y_1</math> will be replaced with the linear model.)</p>	
<p>Press <b>GRAPH</b> <b>F1</b> (<math>y(x)=</math>) to see the equation of the model in the <math>y_1</math> location. If you cannot see all of the equation, press the right arrow key to scroll the screen to the right.</p>	

**1.4.9 GRAPHING A MODEL** After finding a model, you should always graph it on a scatter plot of the data to verify that the model provides a good fit to the data.

<p>TI-85 After you have copied the model to the <math>y(x)=</math> list, run program STPLT to graph the model and the scatter plot on the same screen. The model will graph first and then the scatter plot will appear.</p> <p>TI-86 After viewing the model, be sure that Plot1 at the top of the <math>y(x)=</math> list is darkened. Then, just press <b>EXIT</b> <b>F5</b> (GRAPH) to see the model and scatter plot.</p>	
--	--

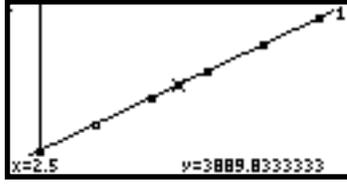

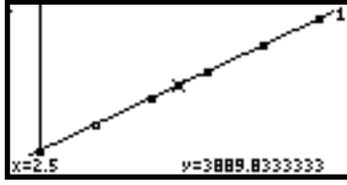

**1.4.10 PREDICTIONS USING A MODEL** You could use one of the methods described in Sections 1.1.7 or 1.2.1 of this *Guide* to evaluate the linear model at the desired input value. Remember, if you have aligned your data, the input value at which you evaluate the model may not be the value given in the question you are asked.

However, your calculator has a feature that gives you a very easy way to predict either input or output values calculated from a model.

<p>After finding a model,</p> <p>TI-85 press <b>STAT</b> <b>F4</b> (FCST)</p> <p>TI-86 press <b>2nd</b> <b>+</b> (STAT) <b>MORE</b> <b>F1</b> (FCST)</p> <p><b>Both</b> Now all you need do is enter the input value <math>x</math> or the output value <math>y</math> and press the SOLVE key to find the value of the variable you didn't enter.</p>	
--	---

<p>Predict the tax owed in 1998 where the tax is found using the linear model computed from the data given in Section 1.4.1 of this <i>Guide</i>:</p> <p>Tax = <math>540.37143t + 2538.90476</math> dollars and <math>t</math> is the number of years since 1992.</p> <p>Note that 1998 is six years since 1992, so <math>x = 6</math>. Enter 6 in the <math>x</math> location, press <math>\blacktriangledown</math> to move to the <math>y</math> location, and press <math>\boxed{\text{F5}}</math> (SOLVE).</p>	 <p>The 1998 tax is predicted to be about \$5781.</p>
<p>Predict the year in which the tax will be \$6000.</p> <p>Enter 6000 in the <math>y</math> location, press <math>\blacktriangle</math> to move to the <math>x</math> location, and press <math>\boxed{\text{F5}}</math> (SOLVE). Remember the data is aligned, so the answer is about <math>1992 + 6.4</math> or near the middle of 1999.</p>	

**1.4.11 COPYING GRAPHS TO PAPER** Your instructor may ask you to copy what is on your graphics screen to paper. If so, use the following to more accurately perform this task.

<p><b>TI-85</b> Press <math>\boxed{\text{GRAPH}}</math> to return the graph to the screen.</p> <p>Press <math>\boxed{\text{F4}}</math> (TRACE) to trace the graph.</p> <p>Use <math>\blacktriangleright</math> and/or <math>\blacktriangleleft</math> to locate several values that are as “nice” as possible and mark those points on your paper. Use a ruler to connect the linear model points.</p>	
<p><b>TI-86</b> Press <math>\boxed{\text{GRAPH}}</math> to return the graph to the screen.</p> <p>Press <math>\boxed{\text{F4}}</math> (TRACE) to trace the graph. The P1 in the upper right-hand corner of the screen indicates that you are tracing the scatter plot of the data. Use either these trace values or the data lists to mark the data points on your paper.</p>	
<p><b>Both</b> Press <math>\blacktriangledown</math> to move the trace cursor to the linear model graph. The number 1 at the top right of the screen tells you which function you are tracing (in this case, <math>y_1</math>).</p> <p>Use <math>\blacktriangleright</math> and/or <math>\blacktriangleleft</math> to locate values that are as “nice” as possible and mark those points on your paper. Use a ruler to connect the model points and draw the line.</p>	

**1.4.12 WHAT IS “BEST FIT”?** Even though your calculator easily computes the values  $a$  and  $b$  for the best fitting linear model  $y = ax + b$ , it is important to understand the method of least-squares and the conditions necessary for its application if you intend to use this model. You can explore the process of finding the line of best fit with program LSLINE. (Program LSLINE is given in the TI-85/TI-86 Appendix.) For your investigations of the least-squares

process with this program, it is better to use data that is not perfectly linear and data for which you do *not* know the best-fitting line.

Before using program LSLINE, clear the  $y(x)=$  list and enter your data in lists L1 and L2. Next, draw a scatter plot. Reset  $xScl$  and  $yScl$  so that you can use the tick marks to help identify points on the graphics screen. Press **GRAPH** to view the scatter plot.

To activate program LSLINE, press **PRGM** **F1** (NAMES) followed by the F-key under the program, and press **ENTER**. (Since your calculator “loads” each program in memory when you run it, longer programs such as this one take a moment before anything appears on the screen.) The program first displays the scatter plot you constructed and pauses for you to view the screen.

- While the program is calculating, there is a small vertical line in the upper-right hand corner of the graphics screen that is dashed and “moving”. The program pauses several times during execution. Whenever this happens, the small vertical line is “still”. You should press **ENTER** to resume execution.

The program next asks you to find the  $y$ -intercept and slope of *some* line you estimate will go “through” the data. (You should not expect to guess the best fit line on your first try!) After you enter a guess for the  $y$ -intercept and slope, your line is drawn and the errors are shown as vertical line segments on the graph. (You may have to wait just a moment to see the vertical line segments before again pressing **ENTER**.)

Next, the sum of squares of errors, SSE, is displayed for your line. Choose the TRY AGAIN? option by pressing **1** **ENTER**. Decide whether you want to move the  $y$ -intercept of the line or change its slope to improve the fit to the data. After you enter another guess for the  $y$ -intercept and/or slope, the process of viewing your line, the errors, and display of SSE is repeated. If the new value of SSE is smaller than the SSE for your first guess, you have improved the fit.

When it is felt that an SSE value close to the minimum value is found, you should press **2** at the TRY AGAIN? prompt. The program then overdraws the line of best fit on the graph for comparison with your last attempt and shows the errors for the line of best fit. The coefficients  $a$  and  $b$  of the best-fitting linear model  $y = ax + b$  are then displayed along with the minimum SSE. Use program LSLINE to explore the method of least squares to find the line of best fit.

#### 1.4.13 NAMING DATA LISTS (optional) You may or may not want to use the additional features given below for data entered on your calculator. You can name data (either input, output, or both) and store it in the calculator memory for later recall.

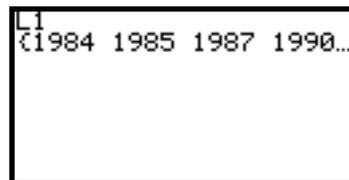

For instance, suppose you wanted to call the following list L1 by another name :

1984 1985 1987 1990 1992

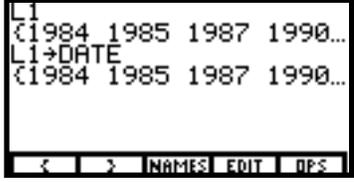

First, enter the data in the list L1.

Return to the home screen.

(You can view any list from the home screen by typing its name and pressing **ENTER**.)

L1  
1984 1985 1987 1990...

<p>Pressing  allows you to scroll through the list to see the portion that is displayed.</p> <p>Type L1, press , type the letters D A T E and press  to store this list with the name DATE. This list should now appear in your list menu.</p>	
<p>If you later want to access this list, press   (LIST). Under NAMES, find DATE. Press the number corresponding to the location of the list, press , and type the location you wish to move the list to (say, L1). Press .</p>	

- TI-85** The original data remains in DATE. It is not deleted until you delete it using   (MEM)  (DELET)  (LIST), move the cursor with  to the location of DATE, and press . Press   (QUIT) to return to the home screen.
- TI-86** The original data remains in DATE. It is not deleted until you delete it using   (MEM)  (DELET)  (LIST), move the cursor with  to the location of DATE, and press . Press   (QUIT) to return to the home screen.
